

Devblog 2 - Game Design & Milestones

Introduction

The game I'm planning to make takes inspiration from an old game I used to play as a kid called "Icy-Tower", which was a popular platform game released within December 22, 2001 making the game 24 years old to this date. Within this game the only objective was to climb the tower while the speed increased overtime making it difficult to keep platforming upwards and the player would eventually slip up and fall to their death.

I choose this game as my inspiration because I feel like it fits well for an arcade setup because I would say that it would require minimal player input, "W,A,S,D" for movement, "SPACE" for jumping and whatever input for attacking.

Game-Design

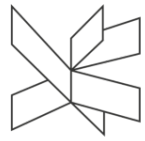

I'm trying to mimic "Icy-Tower" but with a twist, I'll still implement the endless upwards tower mechanic, but instead of falling to your death and being a solo experience, it'll be a two player game where the objective is to manage your character in addition to trying to outlive your opponent, whether it's actively attacking the opponent, or avoiding them in hopes you can outlive them.

Milestones and goals 1-2

Within this section I'll outline the requirements I would like to implement into my game.

- **2D Game:** The game will be designed and developed for 2D implementations
- **Endless Background:** The game will loop through images seamlessly to make it seem like the tower is endless
- **Endless Platforms:** The players would need platforms to navigate upwards to avoid death
- **Characters:** Player1 and Player2 must have a controllable character which has 2D animations for running, jumping and attacking
- **Lava Pool:** Would be placed at the bottom of the screen, implement some sort of idle animation, and in addition whenever players hit the collider, have a lava splash effect animation.

Milestones and goals 2-2

- **Weapons:** Weapons will spawn on the platforms, which they can be picked up by players. Knife: shank players, Bat: knockback effect, AK-47 : Shoot with projectiles.
- **Character Hurt Animations:** Whenever a player gets hurt, blood particles should spawn
- **Sound Effects:** For whenever players get hurt, lava splash effect on collide, weapons on hit/activation, main menu music and in-game music
- **Random Events:** This section would implement random events like boulders falling down dealing massive damage, or some other entity/event to take place
- **Platforms Speed Up:** Implement some sort of speeding up for the platforms to make things more stressful for the players, either in bursts or overtime.
