

Devblog 3 - EndlessManager's

EndlessBackground Manager

For this component, I've created an empty game object to house a script called "EndlessBackgroundManager.cs" which is responsible for deceiving the player into thinking that throughout the gameplay the characters are climbing an endless tower. This logic works by assigning two pictures of the same resolution, and looping that within an assigned scroll speed, the speed is determined by "EndlessPlatformsManager.cs", which updates the speed every "x" amount of seconds, which increases the game pace over time. I've also added the ability to add more pictures, so it doesn't become repetitive, but currently am only utilizing 3 pictures, which is enough to give the illusion of an endless climbing tower.

EndlessPlatforms Manager

This component is also suited within an empty game object, and it's responsible for spawning platforms that the player can climb and traverse through. This script defines an area to which the platforms spawn, and how evenly they should be spread out.
